**Method for preparing oligonucleotides**

The present invention relates to a method for preparing oligonucleotides.

The synthesis of oligonucleotides has been the subject of investigations for a long period of time. Automated synthesis procedures have been developed and apparatus for the automated syntheses are commercially available. Most of these procedures have been developed for rather small quantities of oligonucleotides (in the range of mg). These amounts are sufficient for most investigational purposes.

Especially with the development of antisense therapeutics, large scale synthesis became a matter of considerable importance. Although relative large scale amounts of oligonucleotides have been obtained by scale-up of solid phase synthesis procedures, these technologies show major limitations especially high costs for reagents and materials, e.g. the solid phase bound starting oligonucleotide.

With scale-up, the reaction time of each step of the synthesis increases.

Furthermore oligonucleotides synthesis by standard solid phase synthesis results in a contamination of the desired full length compound by failure sequences arising from incomplete reaction during the synthesis cycle. At large scales the purification of the crude oligonucleotide involves complicated isolation and chromatographic purification of the final product.

In general, synthesis methods for oligonucleotides consist of a four-step procedure for the elongation of the oligonucleotide

1. Coupling

2. Capping

3. Oxidation

4. Deprotection of the protected hydroxyl group for the next reaction cycle.

One object of the present invention is to provide a method for the preparation of oligonucleotides suitable for large scale (kilogram to tons) synthesis.

A further object of the present invention is to provide a method for the preparation of oligonucleotides avoiding complicated purification steps, especially chromatographic purifications, especially during synthesis cycles.

A further object of the invention is to provide a method for the preparation of oligonucleotides allowing an effective convergent synthesis.

In one embodiment this object is solved by a liquid phase synthesis method, comprising the steps of

a) providing a 3'-protected compound having the formula:

5 wherein

B is a heterocyclic base

R<sub>2</sub> is H, a protected 2'-hydroxyl group, F, a protected amino group, an O-alkyl group, an O-substituted alkyl, a substituted alkylamino or a C4'-O2' methylene linkage

10 R<sub>3</sub> is OR'<sub>3</sub>, NHR''<sub>3</sub>, NR'''<sub>3</sub>R'''<sub>3</sub>, a 3'-protected nucleotide or a 3'-protected oligonucleotide,

R'<sub>3</sub> is a hydroxyl protecting group,

R''<sub>3</sub>, R'''<sub>3</sub> are independently an amine protecting group,

15 b) reacting said compound with a nucleotide derivative having a 5'-protection group in the presence of a solid supported activator to give an elongated oligonucleotide with a P(III)-internucleotide bond

c) optionally processing the elongated oligonucleotide with a P(III)-internucleotide bond by either or both of steps c1) and c2) in any sequence

c1) capping, preferably by reacting with a solid supported capping agent

20 c2) oxidizing, preferably by reacting the oligonucleotide with a solid supported oxidizing reagent

d) removing the 5'-protection group.

25 The method of the present invention is a solution phase synthesis wherein at least some of the reagents are solid supported. "Solid supported" covers covalently bound reagents and reagents bound to a solid support by ionic forces.

In a preferred embodiment, step d) is effected by treatment with a solid supported agent or removing the 5'-protection group with a removal agent followed

by addition of a solid supported scavenger or followed by extraction.

In most cases coupling occurs of a 5'-OH-synthon with a 3'-phosphorous-synthon. Alternatively coupling of a 5'-phosphorous-synthon with a 3'-OH-synthon is also possible. Therefore in a further embodiment the invention comprises a method comprising the steps of

a) providing a 5'-protected compound having the formula:

wherein

B is a heterocyclic base

10  $R_2$  is H, a protected 2'-hydroxyl group, F, a protected amino group, an O-alkyl group, an O-substituted alkyl, a substituted alkylamino or a C4'-O2' methylene linkage

$R_3$  is OH,  $NH_2$

15  $R_5$  is a hydroxyl protecting group, a 5'-protected nucleotide or a 5'-protected oligonucleotide

b) reacting said compound with a nucleotide derivative having a 3'-protection group in the presence of a solid supported activator to give an elongated oligonucleotide with a P(III)-internucleotide bond

20 c) optionally processing the elongated oligonucleotide with a P(III)-internucleotide bond by either or both of steps c1) and c2) in any sequence

c1) capping, preferably by reacting with a solid supported capping agent

c2) oxidizing, preferably by reacting the oligonucleotide with a solid supported oxidizing reagent

d) removing the 3'-protection group.

25 In a preferred embodiment, step d) is effected by treatment with a solid supported agent or removing the 3'-protection group with a removal agent followed by addition of a solid supported scavenger or followed by extraction.

In further embodiments, it is possible to couple a 3'-phosphorous synthon with a 3'-OH synthon to form a non-natural 3'-3'-internucleosidic linkage. For the synthesis of non-natural 5'-5'-internucleosidic linkages it is possible to react a 5'-phosphorous synthon with a 5'-OH synthon. These non-natural internucleosidic linkages show increased nuclease resistance.

**Step a)**

B, the heterocyclic base can be a natural nucleobase or a modified one including a non-base residue. The natural nucleobases are adenine, guanine, thymine, cytosine and uracil. In general these bases need protection groups during the synthesis. Suitable protected nucleobases are known to persons skilled in the art for example N-4-benzoylcytosine, N-6-benzoyl adenine, N-2-isobutyryl guanine, N-4-acetyl or isobutyryl cytosine, N-6-phenoxyacetyl adenine, N-2-tert-butyl phenoxyacetyl guanine. Suitable non-base residues include for example Hydrogen, H leading to the 1',2'-dideoxyribose (dSpacer from Glen Research) which can be used as linker or to mimic abasic sites in an oligonucleotide (Takeshita et al., J. Biol. Chem., 1987, 262, 10171).

Furthermore, it is also possible to use isomers of nucleosides such as L, D,  $\alpha$ ,  $\beta$  and the like.

A suitable protection for the 2'-hydroxyl-group include but are not limited to tert-butyl dimethylsilyl (TBDMS), triisopropylsilyloxymethyl (TOM), fluorophenyl-metoxypiperidiny (FPMP).

Suitable protecting groups for the 3'-hydroxyl-group include but are not limited to tert-butyl dimethylsilyl (TBDMS), levulinyl, benzoyl. This compound is then reacted with a nucleotide derivative with a 3'-phosphorous-synthon. The nucleotide derivative preferably has the following formula

(Formula III)

wherein

X is a P(III)-function

B is a heterocyclic base

$R_2$  is H, a protected 2'-hydroxyl group, F, a protected amino group, an O-alkyl group, an O-substituted alkyl, a substituted alkylamino or a C4'-O2' methylen linkage

$R_5$  is a hydroxyl protecting group, a 5'-protected nucleotide or a 5'-protected oligonucleotide.

In the second embodiment, the nucleotide derivative preferably has the following formula

(Formula IV)

wherein

X is a P(III)-function

B is a heterocyclic base

$R_2$  is H, a protected 2'-hydroxyl group, F, a protected amino group, an O-alkyl group, an O-substituted alkyl, a substituted alkylamino or a C4'-O2' methylen linkage

$R_3 = OR'_3, NHR''_3, NR'''_3R'''_3$ , a 3'-protected nucleotide or a 3'-protected oligonucleotide,

$R'_3$  is a hydroxyl protecting group,

$R''_3, R'''_3$  are independently an amine protecting group,

$R'_3$  is a hydroxyl protecting group, a 3'-protected nucleotide or a 3'-protected oligonucleotide

### **Step b): The coupling step**

In step b) the coupling of the nucleotide or oligonucleotides occurs. The chemistry of the reaction depends on the type of activated phosphorous compound.

Several methods for coupling nucleotides are known. The most common methods are via phosphoramidite and via H-phosphonate. In each of these cases the phosphorus is in an activated state which allows coupling with the free hydroxyl group of the other part.

- 5 In phosphoramidite chemistry (Beaucage et al., Tetrahedron, 1992, 48, 2223-2311; Beaucage and Caruthers in unit 3.3 of Current Protocols in Nucleic Acid Chemistry, Wiley) a nucleoside or oligonucleotide-3'-O-phosphoramidite where the P(III) phosphorus is substituted with a dialkylamine (phosphite activating group) and a phosphorus protecting group (including but not limited to 2-cyanoethyl, methyl) is reacted with 5'-hydroxyl nucleoside or oligonucleotide in  
10 presence of an activator to create a phosphite triester internucleosidic linkage.

- In H-phosphonate chemistry (Froehler, Methods in Molecular Biology. Protocols for oligonucleotides and analogs, Humana Press, 1993, 63-80; Strömberg and Stawinski, in unit 3.4 of Current Protocols in Nucleic Acid Chemistry, Wiley) a  
15 nucleoside or oligonucleotide-3'-O-H-phosphonate is reacted with a 5'-hydroxyl nucleoside or oligonucleotide in presence of an activator to create a H-phosphonate diester internucleosidic linkage.

- Suitable activators for the coupling step in phosphoramidite chemistry include, but are not limited to a solid support bearing a pyridinium salt, for example a  
20 solid support covalently linked to pyridine e.g. poly(vinyl)-pyridinium or the pyridinium is a counter ion of a cation exchange solid support. The cation exchange support can be a strong or a weak exchanger, for example a sulfonic acid or a carboxylic acid. The pyridinium salt can also be a substituted pyridinium salt, for example dichloropyridinium. It can further be a solid support  
25 bearing an optionally substituted azole (imidazole, triazole, tetrazole), or is the salt of a weak base anion exchange resin with a strong acid, or a weak cation exchange resin (carboxylic) in its protonated form (see US patent 5,574,146), or a solid support bearing an optionally substituted phenol (see W. Dabkowski and al., Tet Lett, 2000, 41, 7535-7539).

- 30 The use of imidazole is less preferred.

- For the H-phosphonate method the suitable activators include, but are not limited to solid supports bearing a carboxylic acid chloride, sulfonic acid chloride, a chloroformate, a chlorosulfite or a phosphorochloridate or the respective Br-compounds. Further compounds are disclosed in WO 01/64702 A1, page 6, line  
35 36 to page 8, line 5, incorporated by reference and CB Reese and Q Song, Nu-

cleic Acid Res., 1999, 27, 963-971.

### **Step c) Capping and Oxidizing**

Capping is understood as a reaction wherein a reagent reacts with remaining protected compounds of step a). As the capping agent is preferably solid supported, the 3'-protected compound can be removed together with the solid supported capping agent.

For the capping step suitable reagents suitable capping agents include, but are not limited to activated acids for example carboxylic acid, chloride or sulfonic acid chloride, carboxylic acid bromide, azolide, substituted azolide, anhydride or chloroformate or phosphorochloridate, or a solid supported phosphoramidate, or a solid supported H-phosphonate monoester. The acid group is preferably an acid group covalently bound to a solid support. Commercially available cationic exchanger resins can be used as a starting material for synthesizing the solid supported carboxylic acids or sulfonic acids.

The oxidizing reaction is used to oxidize the P(III)-internucleotide bond to a P(V)-internucleotide bond. Capping can be performed before oxidizing and vice versa. Depending on the reagents capping and oxidizing may also be combined in one step.

In case of H-phosphonate chemistry, the oxidizing step is preferably done in every second or third cycle or at the end of synthesis only. In phosphoramidite chemistry removal of the excess of 5' nucleoside oligonucleotide can be facilitated by a hydrolysis step, for example with water.

For the oxidizing step the oxidizing reagent can be any oxidizing reagent used for prior art solid phases, preferably in the form of solid supported agent, either covalently bound or bound by ionic forces. Suitable reagents are solid supported periodates, permanganates, osmium tetroxides, dichromates, hydroperoxides, substituted alkylamine oxides, percarboxylic acid and persulfonic acid.

These compounds are negatively charged, therefore they can be solid supported by a suitable ion exchanger for example an ion exchanger bearing ammonium groups. These substances could be bound to solid support consisting for example of an amino, alkyl amino, dialkyl amino or trialkyl amino anion exchanger.

In oligonucleotides synthesis for investigational purposes and especially for antisense therapeutics phosphorthioate analogs are used. In this case the oxidizing is a sulfurization. As a solid supported oxidizing reagent a solid supported sulfu-

rization reagent is used, for example a solid supported tetrathionate, a solid supported alkyl or aryl sulfonyl disulfide, a solid supported optionally substituted dibenzoyl tetrasulfide, a solid supported bis(alkoxythiocarbonyl)tetrasulfide, a solid supported optionally substituted phenylacetyl disulfide, a solid supported N-  
5 [(alkyl or aryl)sulfanyl] alkyl or aryl substituted succinimide and a solid supported (2-pyridinyldithio) alkyl or aryl.

Very preferred is a solid supported cyanoethylthiosulfate ( $\text{NC-CH}_2\text{-CH}_2\text{S-SO}_3^-$ ), available according to the procedure in US 3,506,676 or a solid supported tetrathionate.

10 **Step d) Deprotection**

Suitable 5'-protection groups include, but are not limited to trityl groups, preferably a dimethoxytrityl group (DMTr) or a monomethoxytrityl group (MMTr). These protection groups are used in conventional prior art solid phase oligonucleotides synthesis. Other suitable 5'-protection groups include, but are not limited to  
15 tert-butyl dimethylsilyl (TBDMS), levulinyl, benzoyl, fluorenylmethoxycarbonyl (Fmoc), the 9-phenylthioxanthene-9-yl (S-pixyl).

In the second embodiment, in step d) the 3'-protection group is removed. Suitable 3'-protection groups include, but are not limited to 3'-O-tert butyl dimethyl silyl (TBDMS), 3'-O-acetate, 3'-O-levulinyl groups. They can be removed by a  
20 solid-supported ammonium fluoride, solid-supported ammonium hydroxide or solid-supported hydrazine.

In step d) of the first embodiment, the 5'-protection group is removed. Thereafter the oligonucleotides can either be used or the oligonucleotide corresponds to the 3'-protected compound of step a) to repeat the cycle.

25 The use of solid supported reagents for the removal of the DMTr-protection group for a completely synthesized oligonucleotide has already been reported in US 5,808,042. The content of this document is incorporated by reference. Surprisingly the methods disclosed in US 5,808,042 can also be applied in a solution phase synthesis as described in the present application.

30 Suitable reagents are also disclosed in synthetic communications 24 (17) 1994, 2323-2428.

In step d) of the second embodiment, the 3'-protection group is removed. Thereafter the oligonucleotides can either be used or the oligonucleotide corresponds to the 5'-protected compound of step a) to repeat the cycle.

**Step e): Repetition**

In most cases the methods will be repeated at least once. When starting from monomeric oligonucleotides the method of the present invention will result in a dimer. Repeating the method of the present invention will elongate the dimer to a trimer. By repeating the method of the invention several times n-mers can be synthesized.

As the yield of a synthesis is not 100%, the overall yield of correct oligonucleotides decreases with the number of cycles. Depending on the yield of a single cycle, oligonucleotides can be synthesized of at least up to 100 nucleotides in sufficient yield, but longer oligonucleotides are also possible.

For most cases oligonucleotides having that size will not be needed. An antisense therapy oligonucleotides are normally in the range of 8-36 nucleotides, more preferably 12-30, most commonly in the range of the 16-26 nucleotides.

In contrast to prior art, convergent synthesis strategies are fully compatible with the synthesis method of the present invention. Convergent synthesis methods are methods wherein small oligonucleotides are synthesized first and the small oligonucleotides are then combined for synthesizing larger blocks. By this method the number of coupling reactions can be significantly reduced. Thereby the overall yield of the oligonucleotide is increased.

In prior art, each synthesis of a small oligonucleotide had to start from the solid support bound nucleic acid which was rather expensive. Therefore convergent synthesis strategies have not found much application in oligonucleotide synthesis.

Convergent synthesis has the further advantage, that the reaction product is essentially free of (n-1)mers. In prior art synthesis, the purification of oligonucleotides with a length of n from oligonucleotides with a length of n-1 is the most difficult in purification of the oligonucleotide. By convergent synthesis, these (n-1)mers are nearly avoided, because larger fragments are combined.

In a preferred embodiment, the method of the present invention uses dimers or trimers as the compounds in step a) and/or b).

During the synthesis cycles, reagents are mostly added in a solid supported form. These solid supported reagents are preferably removed after reaction or after each reaction step. Depending on the type of reagent it is in some cases possible to remove two or more of the solid supported reagents together.

In a preferred embodiment, coupling and at least final oxidizing steps are done by solid supported reagents.

As the synthesis is intended for the production of large amounts of oligonucleotides it is preferred that the solid supported reagent is recycled. This recycling is obviously easier if the solid supported reagents are removed separately after each reaction.

The solid supported reagents can be removed by methods like filtration or centrifugation. Because of the ease of handling, filtration is the preferred way of removing the solid supported reagents.

10 A very preferred reagent for the sulfurization is a solid supported anion exchange resin in complex with a tetrathionate having the formula  $S_4O_6$ , preferably a quaternary ammonium resin bearing tetrathionate as counter ion.

### **Purification**

After the final synthesis cycle, it will in most cases be necessary to make one or more additional purification steps. Such purification steps for crude oligonucleotide synthesis products are known in prior art solid phase synthesis.

It is necessary to remove the remaining protection groups especially from the heterocyclic bases and optionally remaining protecting groups on the sugar or phosphorous backbone.

20 In a preferred embodiment, in case of the use of MMT or DMT as a protection group, the oligonucleotide is purified by binding to an ion exchanger and the protection group is removed while the oligonucleotide is bound to the exchanger. After removal of the protection groups, the oligonucleotide is released from the ion exchanger.

25 The invention will be further exemplified with the following examples.

### **Example 1**

*Synthesis of the dimer 5'-O-DMTr-T-T-3'-O-TBDMS cyanoethyl phosphite triester.*

30 **Coupling procedure** of 5'-O-DMTr-T-3'-cyanoethyl phosphoramidite with 5'-OH-T-3'-O-TBDMS using the DOWEX 50W X8 pyridinium form.

### **Analytical scale.**

5'-OH-T-3'-O-TBDMS (11 mg, 32.5 mmol) and 5'-O-DMTr-T-3'-cyanoethyl

phosphoramidite (41 mg, 55.25 mmol, 1.7 eq) are dissolved in anhydrous acetonitrile (550 ml). The solution is transferred under argon in a NMR tube containing the DOWEX 50W X8 pyridinium form (100 mg, 0.30 mmol pyrH<sup>+</sup>, 9.2 eq). The reaction is followed by <sup>31</sup>P NMR. Before the NMR experiment  
5 deuterated acetonitrile (50 ml) is added. The yield is determined by <sup>31</sup>P NMR. After 3 h the desired dimer T-T phosphite triester is obtained with 100% of yield compared to 5'-OH-T-3'-O-TBDMS. The crude is a mixture of 5'-O-DMTr-T-3'-cyanoethyl phosphoramidite (<sup>31</sup>P NMR (CD<sub>3</sub>CN) δ 149.14, 149.07, 14.7%),  
5'-O-DMTr-T-T-3'-O-TBDMS cyanoethyl phosphite triester (δ 140.53, 70.2%),  
10 5'-O-DMTr-T-3'-cyanoethyl hydrogenophosphonate (δ 8.74, 15.1%).

### Example 2

*Synthesis of the dimer 5'-O-DMTr-T-T-3'-O-TBDMS cyanoethyl phosphite triester.*

**Coupling procedure** of 5'-O-DMTr-T-3'-cyanoethyl phosphoramidite with 5'-  
15 OH-T-3'-O-TBDMS using the poly(4-vinylpyridinium *p*-toluenesulfonate) (Aldrich).

### Analytical scale.

5'-OH-T-3'-O-TBDMS (11 mg, 32.5 mmol) and 5'-O-DMTr-T-3'-cyanoethyl phosphoramidite (41 mg, 55.25 mmol, 1.7 eq) are dissolved in anhydrous  
20 acetonitrile (550 ml). The solution is transferred under argon in a NMR tube containing the poly(4-vinylpyridinium *p*-toluenesulfonate) (100 mg, 0.33 mmol tosyl<sup>+</sup>, 10.3 eq). The reaction is followed by <sup>31</sup>P NMR. Before the NMR experiment deuterated acetonitrile (50 ml) is added. The yield is determined by <sup>31</sup>P NMR. After 1 h 45 the desired dimer T-T phosphite triester is obtained with  
25 82% of yield compared to 5'-OH-T-3'-O-TBDMS. The crude is a mixture of 5'-O-DMTr-T-T-3'-O-TBDMS cyanoethyl phosphite triester (<sup>31</sup>P NMR (CD<sub>3</sub>CN) δ 140.54, 48.2%), 5'-O-DMTr-T-3'-cyanoethyl hydrogenophosphonate (δ 8.77, 51.8%).

### Example 3

30 *Synthesis of the dimer 5'-OH-T-T-3'-O-TBDMS cyanoethyl phosphorothioate triester.*

**Coupling procedure** of 5'-O-DMTr-T-3'-cyanoethyl phosphoramidite with 5'-OH-T-3'-O-TBDMS using the DOWEX 50W X8 pyridinium form.

A solution of 5'-OH-T-3'-O-TBDMS (124 mg, 0.35 mmol) and 5'-O-DMTr-T-3'-

cyanoethyl phosphoramidite (441 mg, 0.59 mmol, 1.7 eq) in anhydrous acetonitrile (6 ml) is added to DOWEX 50W X8 pyridinium form (1 g, 3 mmol  $\text{pyrH}^+$ , 9.5 eq). The resulting mixture is shaken for 4 h 45. The reaction is followed by  $^{31}\text{P}$  NMR and the yield is also determined by  $^{31}\text{P}$  NMR. The desired dimer 5'-O-DMTr-T-T-3'-O-TBDMS cyanoethyl phosphite triester is obtained with 100% of yield compared to 5'-OH-T-3'-O-TBDMS. The crude is a mixture of 5'-O-DMTr-T-3'-cyanoethyl phosphoramidite ( $^{31}\text{P}$  NMR ( $\text{CD}_3\text{CN}$ )  $\delta$  149.17, 149.10, 5.4%), 5'-O-DMTr-T-T-3'-O-TBDMS cyanoethyl phosphite triester ( $\delta$  140.57, 140.54, 68.3%), 5'-O-DMTr-T-3'-cyanoethyl hydrogenophosphonate ( $\delta$  8.75, 8.71, 26.3%).

**Sulfurization:** The DOWEX 50W X8 resin is filtered off and the resulting solution is added to AMBERLYST A26 tetrathionate form (1.44 g, 2.44 mmol  $\text{S}_4\text{O}_6^{2-}$ , 7 eq.). The reaction is followed by  $^{31}\text{P}$  NMR and the yield is also determined by  $^{31}\text{P}$  NMR. After 20 h the desired dimer 5'-O-DMTr-T-T-3'-O-TBDMS cyanoethyl phosphorothioate triester is obtained with 97% of yield. The crude is a mixture of 5'-O-DMTr-T-3'-cyanoethyl thiophosphoramidate ( $^{31}\text{P}$  NMR ( $\text{CD}_3\text{CN}$ )  $\delta$  71.16, 4.0%), 5'-O-DMTr-T-T-3'-O-TBDMS cyanoethyl phosphorothioate triester ( $\delta$  68.28, 68.23, 69.5%), 5'-O-DMTr-T-3'-cyanoethyl hydrogenophosphonate ( $\delta$  8.75, 8.71, 26.5%). MALDI-TOF MS (negative mode, trihydroxyacetophenone as matrix) ammonia treatment of an aliquot gives 5'-OH-T-T-3'-O-TBDMS phosphorothioate diester:  $[\text{M}-\text{H}]^-$   $m/z_{\text{exp}} = 978.12$ ,  $m/z_{\text{calc}} = 977.13$ .

**Detritylation:** The AMBERLYST A26 is filtered off and the solvent are evaporated. The crude is dissolved in 4ml of  $\text{CH}_2\text{Cl}_2/\text{CH}_3\text{OH}$  (7/3) and cooled in an ice bath. To this solution is added 1 ml of a solution of benzene sulfonic acid 10% in  $\text{CH}_2\text{Cl}_2/\text{CH}_3\text{OH}$  (7/3). The solution is stirred 15 min at  $0^\circ\text{C}$ . The reaction is washed with 10 ml of a saturated solution of  $\text{NaHCO}_3$ , the organic layer is separated, dried ( $\text{Na}_2\text{SO}_4$ ), evaporated, and purified on a silica gel column. The desired dimer T-T is eluted with  $\text{CH}_2\text{Cl}_2/\text{CH}_3\text{OH}$  (95/5). The appropriate fractions are collected and evaporated to give 230 mg of a white foam in a yield of 83% compared to 5'-OH-T-3'-O-TBDMS.  $^{31}\text{P}$  NMR ( $\text{CD}_3\text{CN}$ )  $\delta$  68.29, 68.19. MALDI-TOF MS (positive mode, trihydroxyacetophenone as matrix)  $[\text{M}+\text{H}]^+$   $m/z_{\text{exp}} = 730.46$ ,  $m/z_{\text{calc}} = 730.82$ . The spectrophotometric purity (97%) is determined by HPLC at 260 nm.

#### Example 4

*Synthesis of the trimer 5'-OH-T-T-T-3'-O-TBDMS cyanoethyl phosphorothioate triester.*

**Coupling procedure** of 5'-O-DMTr-T-3'-cyanoethyl phosphoramidite with the dimer 5'-OH-T-T-3'-O-TBDMS cyanoethyl phosphorothioate triester using the DOWEX 50W X8 pyridinium form.

A solution of 5'-OH-T-T-3'-O-TBDMS cyanoethyl phosphorothioate triester (230 mg, 0.31 mmol) and 5'-O-DMTr-T-3'-cyanoethyl phosphoramidite (399 mg, 0.54 mmol, 1.7 eq) in anhydrous acetonitrile (8 ml) is added to DOWEX 50W X8 pyridinium form (1 g, 3 mmol pyrH<sup>+</sup>, 9.5 eq). The resulting mixture is shaken for 5 h. The reaction is followed by <sup>31</sup>P NMR and the yield is also determined by <sup>31</sup>P NMR. The desired trimer 5'-O-DMTr-T-T-T-3'-O-TBDMS cyanoethyl phosphite triester is obtained with 100% of yield compared to the dimer 5'-OH-T-T-3'-O-TBDMS cyanoethyl phosphorothioate triester. The crude is a mixture of 5'-O-DMTr-T-3'-cyanoethyl phosphoramidite (<sup>31</sup>P NMR (CD<sub>3</sub>CN) δ 149.16, 149.10, 17.7%), 5'-O-DMTr-T-T-T-3'-O-TBDMS cyanoethyl phosphite triester (δ 140.85, 140.68, 140.37, 140.30, d 68.07, 68.02, 68.3%), 5'-O-DMTr-T-3'-cyanoethyl hydrogenophosphonate (δ 8.7, 8.68, 14%).

**Sulfurization:** The DOWEX 50W X8 pyridinium form is filtered off and the resulting solution is added to AMBERLYST A26 tetrathionate form (1.3 g, 2.44 mmol S<sub>4</sub>O<sub>6</sub><sup>2-</sup>, 7 eq.). The reaction is followed by <sup>31</sup>P NMR and the yield is also determined by <sup>31</sup>P NMR. After 45 h the desired trimer 5'-O-DMTr-T-T-T-3'-O-TBDMS cyanoethyl phosphorothioate triester is obtained with 100% of yield. MALDI-TOF MS (negative mode, trihydroxyacetophenone as matrix) [M-H]<sup>-</sup> m/z<sub>exp</sub> = 1297.89, m/z<sub>calc</sub> = 1296.38 after 30 min of ammonia treatment to remove the cyanoethyl protecting group. The crude is a mixture of 5'-O-DMTr-T-3'-cyanoethyl thiophosphoramidate (<sup>31</sup>P NMR (CD<sub>3</sub>CN) d 72.04, 71.17, 14.0%), 5'-O-DMTr-T-T-T-3'-O-TBDMS cyanoethyl phosphorothioate triester (d 68.17, 68.12, 68.07, 67.96, 67.80, 67.58, 73.8%), 5'-O-DMTr-T-3'-cyanoethyl hydrogenophosphonate (d 8.76, 8.71, 12.2%).

**Detritylation:** The AMBERLYST A26 is filtered off and the solvent are evaporated. The crude is dissolved in 4ml of CH<sub>2</sub>Cl<sub>2</sub>/CH<sub>3</sub>OH (7/3) and cooled in an ice bath. To this solution is added 1 ml of a solution of benzene sulfonic acid 10% in CH<sub>2</sub>Cl<sub>2</sub>/CH<sub>3</sub>OH (7/3). The solution is stirred 45 min at 0°C. The reaction is washed with 10 ml of a saturated solution of NaHCO<sub>3</sub>, the organic layer is separated, dried (Na<sub>2</sub>SO<sub>4</sub>), evaporated, and purified on a silica gel column. The desired trimer T-T-T is eluted with CH<sub>2</sub>Cl<sub>2</sub>/CH<sub>3</sub>OH (95/5). The appropriate fractions are collected and evaporated to give 221 mg of a white foam in a yield of 63% compared to the dimer 5'-OH-T-T-3'-O-TBDMS cyanoethyl phos-

phorothioate triester.  $^{31}\text{P}$  NMR ( $\text{CD}_3\text{CN}$ )  $\delta$  68.53, 68.38, 68.34, 67.74, 67.54. *Synthesis of the dimer 5'-OH-T-dA<sup>Bz</sup>-3'-O-TBDMS cyanoethyl phosphorothioate triester.*

**Coupling procedure** of 5'-O-DMTr-T-3'-phosphoramidite with 5'-OH-dA<sup>Bz</sup>-3'-O-TBDMS using the poly(4-vinylpyridinium *p*-toluenesulfonate) (Aldrich).

- 10 A solution of 5'-OH-dA<sup>Bz</sup>-3'-O-TBDMS (176 mg, 0.38 mmol) and 5'-O-DMTr-T-3'-cyanoethyl phosphoramidite (560 mg, 0.75 mmol, 2 eq) in anhydrous acetonitrile (6 ml) is added to poly(4-vinylpyridinium *p*-toluenesulfonate) (1.15 g, 3.84 mmol  $\text{tos}^-$ , 10.2 eq). The resulting mixture is shaken for 4 h 30 min. The reaction is followed by  $^{31}\text{P}$  NMR and the yield is also determined by  $^{31}\text{P}$  NMR.
- 15 The desired dimer 5'-O-DMTr-T-dA<sup>Bz</sup>-3'-O-TBDMS cyanoethyl phosphite triester is obtained with 100 % of yield compared to the 5'-OH-dA<sup>Bz</sup>-3'-O-TBDMS. The crude is a mixture of 5'-O-DMTr-T-3'-cyanoethyl phosphoramidite ( $^{31}\text{P}$  NMR ( $\text{CD}_3\text{CN}$ )  $\delta$  149.10, 149.05, 12.3%), 5'-O-DMTr-T-dA<sup>Bz</sup>-3'-O-TBDMS cyanoethyl phosphite triester ( $\delta$  140.52, 140.37, 50%), 5'-O-DMTr-T-3'-cyanoethyl hydrogenophosphonate ( $\delta$  8.72, 8.69, 37.7%).
- 20

**Sulfurization:** The poly(4-vinylpyridinium *p*-toluenesulfonate) is filtered off and the resulting solution is added to AMBERLYST A26 tetrathionate form (1.55 g, 2.63 mmol  $\text{S}_4\text{O}_6^{2-}$ , 7 eq.). The reaction is followed by  $^{31}\text{P}$  NMR. The reaction mixture is shaken for 24 h 30. The desired dimer 5'-O-DMTr-T-dA<sup>Bz</sup>-3'-O-TBDMS cyanoethyl phosphorothioate triester is isolated after filtration of the resin, evaporation of the solvent, and column chromatography (silica gel;  $\text{CH}_2\text{Cl}_2$  / MeOH (50/1)). Yield: 325 mg, 0.28 mmol, 76%.  $^{31}\text{P}$  NMR ( $\text{CD}_3\text{CN}$ )  $\delta$  68.34, 68.15. MALDI-TOF MS (positive mode, trihydroxyacetophenone as matrix)  $[\text{M}+\text{H}]^+$   $m/z_{\text{exp}} = 1144.22$ ,  $m/z_{\text{calc}} = 1146.32$ .

**Coupling procedure** of 5'-O-DMTr-dC<sup>Bz</sup>-3'-cyanoethyl phosphoramidite with 5'-OH-T-3'-O-Lev using the DOWEX 50W X8 pyridinium form.

#### Analytical scale.

15 5'-OH-T-3'-O-Lev (20 mg, 58.9  $\mu$ mol) and 5'-O-DMTr-dC<sup>Bz</sup>-3'-cyanoethyl phosphoramidite (83.4 mg, 100  $\mu$ mol, 1.7 eq) are dissolved in anhydrous acetonitrile (550 ml). The solution is transferred under argon in a NMR tube containing the DOWEX 50W X8 pyridinium form (181 mg, 0.54 mmol pyrH<sup>+</sup>, 9.2 eq). The reaction is followed by <sup>31</sup>P NMR. Before the NMR experiment deuterated acetonitrile (50 ml) is added. The yield is determined by <sup>31</sup>P NMR.

20 After 6 h the desired dimer T-dC<sup>Bz</sup> phosphite triester is obtained with 100% of yield compared to 5'-OH-T-3'-O-Lev. The crude is a mixture of 5'-O-DMTr-dC<sup>Bz</sup>-3'-cyanoethyl phosphoramidite (<sup>31</sup>P NMR (CD<sub>3</sub>CN)  $\delta$  149.36, 149.32, 11%), 5'-O-DMTr-T-dC<sup>Bz</sup>-3'-O-TBDMS cyanoethyl phosphite triester ( $\delta$  140.52, 140.39, 70%), 5'-O-DMTr-dC<sup>Bz</sup>-3'-cyanoethyl hydrogenophosphonate

*Synthesis of the dimer 5'-OH-dC<sup>Bz</sup>-T-3'-O-Lev cyanoethyl phosphorothioate triester.*

30 **Coupling procedure** of 5'-O-DMTr-dC<sup>Bz</sup>-3'-cyanoethyl phosphoramidite with 5'-OH-T-3'-O-Lev using the DOWEX 50W X8 pyridinium form.

A solution of 5'-OH-T-3'-O-Lev (119 mg, 0.35 mmol) and 5'-O-DMTr-dC<sup>Bz</sup>-3'-cyanoethyl phosphoramidite (496 mg, 0.60 mmol, 1.7 eq) in anhydrous acetonitrile (10 ml) is added to DOWEX 50W X8 pyridinium form (1.1 g, 3.3 mmol pyrH<sup>+</sup>, 9.4 eq). The resulting mixture is shaken for 5 h 30 min. The reaction is

followed by  $^{31}\text{P}$  NMR and the yield is also determined by  $^{31}\text{P}$  NMR. The desired dimer 5'-O-DMTr-dC<sup>Bz</sup>-T-3'-O-Lev cyanoethyl phosphite triester is obtained with 100% of yield compared to 5'-OH-T-3'-O-Lev. The crude is a mixture of 5'-O-DMTr-T-dC<sup>Bz</sup>-3'-O-Lev cyanoethyl phosphite triester ( $^{31}\text{P}$  NMR ( $\text{CD}_3\text{CN}$ )  $\delta$  140.59, 140.45, 64%), 5'-O-DMTr-dC<sup>Bz</sup>-3'-cyanoethyl hydrogenophosphonate ( $\delta$  8.68, 8.66, 36%).

**Sulfurization:** The DOWEX 50W X8 resin is filtered off and the resulting solution is added to AMBERLYST A26 tetrathionate form (1.44 g, 2.44 mmol  $\text{S}_4\text{O}_6^{2-}$ , 7 eq.). The reaction is followed by  $^{31}\text{P}$  NMR. The reaction mixture is shaken for 16 h. The desired dimer 5'-O-DMTr-dC<sup>Bz</sup>-T-3'-O-Lev cyanoethyl phosphorothioate triester is isolated after filtration of the resin, evaporation of the solvent and column chromatography (silica gel;  $\text{CH}_2\text{Cl}_2$  / MeOH (97/3)). The crude is a mixture of 5'-O-DMTr-T-dC<sup>Bz</sup>-3'-O-Lev cyanoethyl phosphorothioate triester ( $^{31}\text{P}$  NMR ( $\text{CD}_3\text{CN}$ )  $\delta$  68.05, 67.89, 83.7%), 5'-O-DMTr-dC<sup>Bz</sup>-3'-cyanoethyl hydrogenophosphonate ( $\delta$  8.63, 16.3%). The spectrophotometric purity determined by HPLC at 260 nm is 80%.

**Detritylation of the dimer 5'-O-DMTr-dC<sup>Bz</sup>-T-3'-O-Lev cyanoethyl phosphorothioate triester with the DOWEX 50 W X8 H<sup>+</sup> form (Aldrich).**

To the mixture of the dimer 5'-O-DMTr-dC<sup>Bz</sup>-T-3'-O-Lev cyanoethyl phosphorothioate triester (121 mmol estimated) and 5'-O-DMTr-T-3'-cyanoethyl hydrogenophosphonate diester (44 mmol estimated) in solution in 10 ml of  $\text{CH}_2\text{Cl}_2$ /MeOH (7/3) is added the DOWEX 50 W X8 H<sup>+</sup> form (1.4 g, 7 mmol H<sup>+</sup>, 58 eq / dimer). The reaction is followed by reverse phase HPLC. After 15 min the detritylation is complete. The resin is filtered off and the solvents are evaporated. The desired dimer 5'-OH-dC<sup>Bz</sup>-T-3'-O-Lev cyanoethyl phosphorothioate triester is purified by precipitation from  $\text{CH}_2\text{Cl}_2$ /MeOH (9/1) in diethylether.  $^{31}\text{P}$  NMR ( $\text{CD}_3\text{OD}$ )  $\delta$  68.24, 67.90, MALDI-TOF MS (positive mode, trihydroxyacetophenone as matrix)  $[\text{M}-\text{H}]^+ m/z_{\text{exp}} = 803.11 m/z_{\text{calc}} = 803.76$ . The spectrophotometric purity (97 %) is determined by HPLC at 260 nm.

*Synthesis of the dimer 5'-OH-T-T-3'-O-Lev cyanoethyl phosphorothioate triester.*

**Coupling procedure** of 5'-O-DMTr-T-3'-cyanoethyl phosphoramidite with 5'-OH-T-3'-O-Lev using the DOWEX 50W X8 pyridinium form.

A solution of 5'-OH-T-3'-O-Lev (100 mg, 0.29 mmol) and 5'-O-DMTr-T-3'-

cyanoethyl phosphoramidite (547 mg, 0.73 mmol, 2.5 eq) in anhydrous acetonitrile (10 ml) is added to DOWEX 50W X8 pyridinium form (0.9 g, 2.7 mmol  $\text{pyrH}^+$ , 9.3 eq). The resulting mixture is shaken for 10 h. The reaction is followed by  $^{31}\text{P}$  NMR and by reverse phase HPLC. The excess of 5'-O-DMTr-T-3'-cyanoethyl phosphoramidite is hydrolysed with 500 ml of water. The desired dimer 5'-O-DMTr-T-T-3'-O-Lev cyanoethyl phosphite triester is obtained with 100% of yield compared to 5'-OH-T-3'-O-Lev. The crude is a mixture of 5'-O-DMTr-T-T-3'-O-Lev cyanoethyl phosphite triester (HPLC % Area = 55%) and 5'-O-DMTr-T-3'-cyanoethyl hydrogenophosphonate (HPLC % Area = 45%).

**Sulfurization:** The DOWEX 50W X8 resin is filtered off and the resulting solution is added to AMBERLYST A26 tetrathionate form (0.8 g, 1.5 mmol  $\text{S}_4\text{O}_6^{2-}$ , 5 eq.). The reaction is followed by  $^{31}\text{P}$  NMR and by reverse phase HPLC. After 15 h the desired dimer 5'-O-DMTr-T-T-3'-O-Lev cyanoethyl phosphorothioate triester is obtained with 100% of yield. The crude is a mixture of 5'-O-DMTr-T-T-3'-O-Lev cyanoethyl phosphorothioate triester ( $^{31}\text{P}$  NMR d 68.04, HPLC % Area = 57%), 5'-O-DMTr-T-3'-cyanoethyl hydrogenophosphonate (d 8.77, HPLC % Area = 43%).

**Detritylation of the dimer 5'-O-DMTr-T-T-3'-O-Lev cyanoethyl phosphorothioate triester with the DOWEX 50 W X8  $\text{H}^+$  form (Aldrich).**

The AMBERLYST A26 resin is filtered off and the solvents are evaporated. To the mixture of the dimer 5'-O-DMTr-T-T-3'-O-Lev cyanoethyl phosphorothioate triester (0.29 mmol estimated) and 5'-O-DMTr-T-3'-cyanoethyl hydrogenophosphonate (0.22 mmol estimated) in solution in 20 ml of  $\text{CH}_2\text{Cl}_2/\text{MeOH}$  (7/3) is added the DOWEX 50 W X8  $\text{H}^+$  form (3.7 g, 18.5 mmol  $\text{H}^+$ , 64 eq / dimer). The reaction is followed by reverse phase HPLC. After 30 min the detritylation of the dimer is complete. The resin is filtered off and the solvents are evaporated. The desired dimer 5'-OH-T-T-3'-O-Lev cyanoethyl phosphorothioate triester is purified by precipitation from  $\text{CH}_2\text{Cl}_2/\text{MeOH}$  (9/1) in diethylether.  $^{31}\text{P}$  NMR ( $\text{CD}_3\text{CN}$ ) d 67.88, 67.73. ## 10 SYNTHESIS OF RESINS

### Example 36

*Synthesis of AMBERLYST A26 periodate form.*

10 g commercial Amberlyst A26 hydroxide form (Rohm & Haas) is washed twice with 20 ml methanol and twice with 20 ml dichloromethane and dried in vacuum. Potassium tetrathionate (10 g, 47 mmol, 1.4 eq.) is dissolved in 300 ml deionized water. The solution is added to the resin and shaken for 17 hours. The solution is filtered off. Another time Potassium tetrathionate (10 g, 47 mmol, 1.4 eq.) is dissolved in 200 ml deionized water. The solution is added to the resin and shaken for 6 hours. The solution is filtered off. The resin is washed with 1 l deionized water, twice with 30 ml methanol and twice with 30 ml dichloromethane and dried under reduced pressure for 3 hours to give 8.2 g of solid-supported periodate. The reagents loading was determined by elemental analysis, giving a value of 27.16% for iodine (3.40% for nitrogen and 40.20% for carbon. Loading: 2.14 mmol IO<sub>4</sub><sup>-</sup> per gram of resin. The resin can be recycled applying the same protocol. Comparable resins are commercially available.

### Example 37

*Synthesis of AMBERLYST 15 hydrazine form.*

5 g commercial Amberlyst 15 H<sup>+</sup> form (Aldrich) is washed successively with 20 ml hydrochloric acid and with 500 ml deionized water. Hydrazine (4.38 g, 87.5 mmol, 3.8 eq.) is dissolved in 100 ml deionized water. The solution is added to the resin and shaken for 16 hours. The solution is filtered off. The resin is washed successively with 500 ml deionized water, 50 ml methanol and with 50 ml dichloromethane and dried under reduced pressure for 3 hours to give 5.2 g of solid-supported hydrazine. The reagents loading was determined by ele-

mental analysis, giving a value of 10.94 % for nitrogen (12.37% for sulfur and 44.19% for carbon. Loading: 3.91 mmol  $\text{N}_2\text{H}_5^+$  per gram of resin.

### Example 38

#### *Recycling of poly(4-vinylpyridinium p-toluenesulfonate)*

- 5 Used poly(4-vinylpyridinium p-toluenesulfonate) (20 g) is washed successively for one hour each with acetonitrile (100 ml), dichloromethane (100 ml) and methanol (100 ml). Then the resin is added to a solution of p-toluene sulfonic acid (40 g, 0.23 mol) in methanol (400 ml) and shaken for 21 h. The solution is filtered off and the resin is washed with methanol (150 ml) and di-  
10 chloromethane (150 ml) and dried at 80°C under vacuum over  $\text{P}_2\text{O}_5$  for 8 h. The reagents loading was determined by elemental analysis, giving a value of 10.73% for sulfur and 4.90% for nitrogen. Loading: 3.35 mmol  $\text{tos}^-$  per gram of resin.

## SYNTHESIS OF PHOSPHODIESTER OLIGOMERS

### 15 FORMATION OF THE PHOSPHATE TRIESTER BRIDGE

- In this part, we focus on the formation of natural phosphodiester oligomers. The coupling of the phosphoramidite nucleotide and of the 5'-OH nucleoside was performed with the resin polyvinyl pyridinium p-toluene sulfonate (PVP) commercially available from ALDRICH. The oxidation of the phosphite triester  
20 linkage was achieved with the resin polystyrylmethyltrimethylammonium metaperiodate ( $\text{PS-N}(\text{CH}_3)_3^+ \text{IO}_4^-$ ) commercially available from NOVABIOCHEM. Then, the detritylation step was performed in solution with BSA. The purification was an extraction in dichloromethane followed by a precipitation in ether.

GENERAL PROCEDURE FOR THE SYNTHESIS OF 5'-OH-3'-O-Lev CYANOETHYL  
5 PHOSPHOROTHIONOTRIESTER BASE PROTECTED DIMERS USING THE  
PHOSPHORAMIDITE METHOD ON 10 MMOL SCALE

**Coupling procedure** of 5'-O-DMTr-3'-cyanoethyl-phosphoramidite base protected nucleotide with 5'-OH-3'-O-Lev base protected nucleoside using the poly(4-vinylpyridinium *p*-toluenesulfonate) (Aldrich):

10 5'-OH-3'-O-Lev base protected nucleoside (10 mmol) and 5'-O-DMTr-3'-  
cyanoethyl-phosphoramidite base protected nucleotide (15 mmol, 1.5 eq) are  
dissolved in anhydrous dichloromethane (100 ml). The solution is transferred  
under argon in a flask containing the poly(4-vinylpyridinium *p*-  
toluenesulfonate) (100 mmol  $\text{PyrH}^+$ , 10 eq) and shaken. The reaction is fol-  
15 lowed by reverse phase HPLC and is usually complete between 1h30 and 2h30.  
The desired 5'-O-DMTr-3'-O-Lev cyanoethyl phosphite triester base protected  
dimer is characterized by  $^{31}\text{P}$  NMR. The crude is a mixture of 5'-O-DMTr-3'-O-  
Lev cyanoethyl phosphite triester base protected dimer and of 5'-O-DMTr-3'-  
cyanoethyl *H*-phosphonate base protected nucleotide. The poly(4-  
20 vinylpyridinium *p*-toluenesulfonate) is filtered off, washed 3 times with 50 ml of  
 $\text{CH}_2\text{Cl}_2$  and the solution is concentrated to 100 ml.

**Sulfurization:** To the resulting solution is added AMBERLYST A26 tetrathion-  
ate form (50 mmol  $\text{S}_4\text{O}_6^{2-}$ , 5 eq.), and the reaction mixture is shaken. The  
reaction is followed by reverse phase HPLC and  $^{31}\text{P}$  NMR and is usually com-  
25 plete between 1h30 and 2h30. The crude is a mixture of 5'-O-DMTr-3'-O-Lev  
cyanoethyl phosphorothionotriester base protected dimer and 5'-O-DMTr-3'-  
cyanoethyl diester *H*-phosphonate base protected nucleotide. The resin  
AMBERLYST A26 tetrathionate form is filtered off and washed 3 times with 50  
ml of  $\text{CH}_2\text{Cl}_2$ .

**Detritylation:** To the previous solution is added 100 ml of MeOH so that the CH<sub>2</sub>Cl<sub>2</sub>/MeOH ratio is about 7/3. The mixture is cooled at 0°C. To the resulting solution is added 90 ml (56 mmol, 5.6 eq.) of a solution of benzene sulfonic acid 10 % in CH<sub>2</sub>Cl<sub>2</sub>/CH<sub>3</sub>OH (7/3). The solution is stirred at 0°C. The detritylation is monitored by TLC and reverse phase HPLC. The reaction time is between 30 min and 1h. When the reaction is complete, 100 ml of H<sub>2</sub>O is added to the mixture, the solution is shaken for 10 min at 0°C. Then, the reaction is stopped by stirring at 0°C for 10 min with 100 ml of a saturated solution of NaHCO<sub>3</sub>. The solution is diluted with 300 ml of CH<sub>2</sub>Cl<sub>2</sub>. The organic layer is then washed up to 4 times with H<sub>2</sub>O / saturated solution of NaHCO<sub>3</sub> in water (1/1), dried with Na<sub>2</sub>SO<sub>4</sub> (50g) and evaporated. The crude product is dissolved in 50 ml CH<sub>2</sub>Cl<sub>2</sub> and added dropwise to 1 l of diethylether at 0°C to give a white precipitate of the pure desired 5'-OH-3'-O-lev cyanoethyl phosphorothionotriester base protected dimer. The solid is filtered off, washed with 500 ml diethylether and dried under vacuum. The dimer is characterized by <sup>31</sup>P NMR and by MALDI-TOF. The spectrophotometric purity is determined by reverse phase HPLC at 260 nm.
